# 1. Summary

When I created my site I tried my best to make it accessible for everyone by using the alt attribute within the image tags and I have also used the meta description and title tags.
I have tried my best to find good color schemes and I fell upon the purple color that I felt was the most beautiful for my site.
The font that I used is the best in my opinion for the content that I have created, it makes it easily to read.
I felt I have created a beautiful and simple web-site that makes it easy to read and comprehend the information on the site.
With a change in the color schemes and the hover effects used to change the color of the header it makes it easy to comprehend and use.
I am conflicted about if I should maybe have used more pages on the site or not but I felt that the main content is good and gives you the information needed to visit the museum.
I felt that the images are in a good size that doesn't make it look too big or too small, and it shrinks nicely to fit the mobile sizes aswell, making it look nice on mobile and desktop.
One thing I think I should maybe have done was making the site visited underlined on the header so you know which site you are on.

# 2. Body

When I created the site I tried many placements for my images around the webpage, but I liked it best when it was centered to the right of the text, I felt it made it more easy to read when I made it so.

This created a need for the use of display grid to make the images flow to the right of the site.

I used both grid and the combination of media queries to make it responsive and pull the images to the bottom of the site when the page got to mobile sizes.

I felt that this was quite time consuming task to do and it was a puzzle to make it look good because there were so many moving parts, especially when it came to the exhibits page.

I counted 11 different moving parts when it came to the exhibits page, but I feel that I managed to make it look good even though there were so many different parts to make in the grid.

I also used the grid on the about page which counted 8 different moving parts, this is also done well in my opinion, in heinsight I think I could maybe used flex box to do the same in less amount of time but I was so familiar with the grid that I used that instead.

This also dragged the picture to the right and moved the text to the left creating a beautiful layout.

The reason for creating these grids is so that the text doesn't wrap from the entire left and right but is more concentrated on a smaller area so that it is easier to read.

It is easier to read more concentrated text than the wrapping of the entire page because the eyes don't need to move all the way from left to right.

When it comes to the images I tried to make then 400px wide because that is what mobile screens use when browsing the web, it was important that the images wasn't too wide and make the site look cluttered.

When it comes to the header I felt I made a good decision when it came to my css, it targets the nav elements good so that I didn't need to make different rules for the different pages that I created.

So the styles and sizes shrinked and grows with the page size so that it looks quite good on both mobile and desktop sizes.

I chose to make the font color white, because the contrast between the page color and black would make it difficult to read.

And i also chose to make the headlines into bigger size to make a hierarchy for the text so that it is easier to understand.

When it comes to the contact page I wanted to make a map picture because that's what is often showed when it comes to showing the location of the museum, because you want the people to know where it is.

I also used a new way to shrink the hours part of the page so that it is shrieked to show each different opening hour of the day on a new line.

This was the word break attribute which Ive never used before, but It worked out perfectly showing the page in a easier to read format.
